Kylian Mbappé Goals Prediction

Supervised machine learning project

1. Selected Player

Kylian Mbappé is a French international footballer who plays as a forward for the France national team.

2. Objective

The aim is to predict how many goals Mbappé may score in his next international match using his previous match statistics.

3. Approach

Supervised learning will be used to train the model on historical international match data with known goal totals.

4. Model

A Decision Tree will be the primary model, while Random Forest will be used to compare prediction results.

5. Reason

- **Supervised Learning:** Learns from previous matches with known goal counts.
- **Decision Tree:** Identifies patterns involving opponents and match conditions.
- **Random Forest:** Combines multiple trees to help improve prediction consistency.

6. Dataset (Authentic Sources)

Main source (FBref): International match logs and performance statistics.

https://fbref.com/en/players/42fd9c7f/matchlogs/nat_tm/Kylian-Mbappe-Match-Logs

Verification source (ESPN): Player profile and available international statistics.

https://www.espn.com/soccer/player/bio/_/id/231388/kylian-mbappe

We will collect match-by-match data from FBref and verify the available records with ESPN. The dataset will include opponents, match dates, and goals scored, which will be used to train and evaluate both models.
